CLEARFIELD® Rice Production System

When the CLEARFIELD® herbicide production system is used, some of the toughest rice weeds are controlled, including red rice. It provides the broadest spectrum control. So, it is easier than ever to help protect your crop from yield-robbing weeds.

**Prowl® H₂O** herbicide is an important tool for resistance management. Prowl H₂O also allows you to delay flooding by providing residual control of tough grasses like barnyardgrass, panicum, sprangletop and broadleaf weeds, including pigweed species.

**General Rate and Timing:**
- Apply at 2.0 pt/A delayed PRE after rice planting prior to rice and weed emergence.
- May be applied on all rice varieties and hybrids, except water-seeded rice.
- Target weeds: junglerice, sprangletop and barnyardgrass.

**Facet® 75 DF Herbicide** provides reliable and consistent broad-spectrum control of broadleaf weeds and grasses, such as hemp sesbania, jointvetches and propanil-resistant barnyardgrass.

**General Rate and Timing:**
- Apply at 0.4 to 0.5 lb/A early POST at 10-20 gallons per acre.
- May be applied on all rice varieties and hybrids at spike to 2-leaf stage (dry- or water-seeded).
- Target weeds: barnyardgrass, broadleaf signalgrass and hemp sesbania.

Always follow CLEARFIELD rice stewardship requirements and recommendations to minimize resistance development of red rice or other weeds.
**NEWPATH®** herbicide is the industry standard in the fight against red rice, barnyardgrass and other tough weeds in fields where CLEARFIELD rice varieties and hybrids (not less than 75% hybrid seed) are grown.

**General Rate and Timing:**
- Apply first Newpath treatment at 4-6 oz/A + COC at 1% v/v on spike to 2-leaf stage rice followed by a rainfall or flushing event.
- Apply second Newpath treatment at 4-6 oz/A + COC at 1% v/v Early Post on 3- to 5-leaf stage rice followed by permanent flood.
- May be applied on CLEARFIELD rice varieties and hybrids ONLY (≥75% hybrid seed).
- Target weeds: red rice and barnyardgrass.

**CLEARPATH®** herbicide is a powerful and convenient combination of the same active ingredients found in NEWPATH and FACET designed to deliver unsurpassed weed control in the CLEARFIELD rice production system.

**General Rate and Timing:**
- Apply at 0.5 lb/A prior to 5-leaf rice stage instead of second NEWPATH application. Follow with permanent flood within 2 days.
- May be applied on CLEARFIELD rice varieties and hybrids ONLY. Maximum one application per use season.
- Target weeds: red rice, barnyardgrass, broadleaf signalgrass and hemp sesbania.

**BEYOND®** herbicide is a unique tool for use as a rescue treatment for control of red rice in a CLEARFIELD rice production system which leads to a cleaner harvest.

**General Rate and Timing:**
- Apply at 5 oz/A + COC at 1% v/v POST to 4-leaf rice to panicle initiation (green ring) on CLEARFIELD hybrids and 4-leaf rice + 14 days after green ring on CLEARFIELD varieties.
- May be applied on CLEARFIELD rice varieties and hybrids after two applications of NEWPATH.
- Target weed: red rice.

Always read and follow label directions.
